2. Use of AI in this Project

AI assistance (Claude, Anthropic) was used in a limited, specific capacity during this project. Its use is disclosed transparently below.

Area	How AI was used	What I did myself
Concept, content and structure	Not used.	Defined the company concept, page structure, section layout, copywriting, product names/specs, and overall visual direction (colors, typography, illustration style) myself.
CSS	Used AI assistance to help write and refine the CSS - layout (grid/flex), responsive breakpoints, animations, and styling of components.	Directed the visual outcome, reviewed and adjusted styling to match my intended design, and tested it across screen sizes.
JavaScript	Used AI assistance to help write the JavaScript - the mobile navigation toggle and scroll-reveal animations.	Specified the required interactions and tested that they worked correctly on desktop and mobile.

3. Design Summary

The page uses a single vertical “motion spine” as its signature visual element — a line-art path with joint markers that splits into a cyan branch (Robotics) and an amber branch (Rehabilitation) in the hero, and reappears through the page to reinforce the idea that both product lines share one underlying science of movement. Sections for the two domains are built as mirrored layouts with equal-sized card grids, so neither domain is visually prioritized over the other. Typography pairs Space Grotesk (display) with Inter (body) and IBM Plex Mono (labels/specs) for a precise, technical feel appropriate to a deep-tech company. The page is fully responsive, tested at desktop (1440px) and mobile (390px) widths.
